

Home Assignment

JFrog Security - Senior PM, Security Adoption

Estimated time: 4-5 hours

Overview

This assignment has two parts. Part 1 tests how you think about a real adoption problem. Part 2 tests whether you can build something to support it. Together, they reflect what you will actually do in this role.

We are looking for clear thinking, strong prioritization, and the ability to ship something with real value. Treat the time box seriously: how you allocate 3-4 hours tells us as much as what you produce.

After submission, you will walk us through both parts in a 45 minutes live debrief. Be prepared to explain your choices and what you would do differently with more time.

Background: The Xray Adoption Problem

JFrog Xray is a software composition analysis (SCA) and security scanning tool that integrates deeply into the JFrog Platform. It scans artifacts, containers, and source code for vulnerabilities (CVEs), license violations, and policy breaches. It is a core part of JFrog's security offering.

The problem: Many customers who have purchased Xray licenses have not fully installed it, have not configured meaningful security policies, and have not reached the point where they see clear security value. CS teams do not have structured playbooks for how to move a stuck customer forward.

What you can assume:

- Xray scans artifacts stored in Artifactory (JFrog's artifact repository)
- It requires configuration: connecting repositories, setting security policies, enabling alerts
- The primary users are DevOps engineers, security engineers, and development team leads
- Customers range from small engineering teams to Fortune 100 enterprises
- CS teams today work reactively -- they respond to tickets, they do not proactively drive security adoption, and focused on DevOps adoption of Fortune 100 enterprises
- You may research Xray publicly (docs.jfrog.com) but do not over-invest in research -- we want your thinking, not your knowledge of the product

Part 1 — Adoption Strategy (Presentation)

What to deliver

Review the background information, and we will spend the first 20 minutes of the interview doing a live brainstorm about Personas, Journeys, and your 30-day plan. Your only takeaway deliverable is the Part 2 Dashboard.

What we will discuss	What we're looking for
Personas	Their goals and pain points
Journey map	What do you plan to do with those customers? Think like a hacker out of the box.
30-day plan	Out of this plan, what do you plan to do in the 1st 30 days?

Part 2 - Adoption Dashboard (Live Application)

What to deliver

Build a live adoption tracking dashboard for the product team, CS or SolEng team members to understand where their customers stand. It does not need real data - we would like to see the dashboard, and that you can use AI to build a **small** application.

Build it using AI. Use whatever tool you prefer - Cursor, Claude, Lovable, Replit, or anything else. The tool choice is yours. The requirement is that it runs, delivers a valuable dashboard that you can explain, and that you can execute your thoughts and ideas.

What we are not looking for:

- A production-grade application with authentication, a real database, or polished UI
- A Figma mockup or a slide showing what a dashboard would look like

What we are looking for:

- A working dashboard (with mock data) that opens in a browser
- Evidence that you used AI to build it - include a brief note on which tool(s) you used and how
- Judgment about what matters: what did you include, what did you leave out, and why

Submission

Part 1: Come prepared for a discussion about Xray customers' adoption plan and their pain.

Part 2: Send a live link to your dashboard or a screenshot, and be ready to present it in the live debrief.

Time box:

We expect 4-5 hours of total work. If you find yourself going beyond that, you may be overcomplicating things, and you can explain that given time, what else you would add. We are evaluating judgment, not endurance.
